H2-IT-Myc

H2-PDZIP-IT-Myc

B.

Figure 1. PDZIP facilitate the surface expression of human T1R2.

- A. Immunofluorescence staining of Myc-tagged hT1R2 indicates that PDZIP significantly increases the amount of human T1R2 protein on the plasma membrane (Staszewski, May 15th, 2001, Notebook No. 2, page 76-77).
- B. FACS analysis data demonstrating the same result (Staszewski, June 4th, 2001, Notebook No. 2, page 79). Myc-tagged human T1R2: Green line. Myc-tagged human T1R2 with PDZIP: black line.

Figure 2. Calcium-imaging data demonstrating hT1R2/hT1R3 responses to a number of sweet stimuli.

Figure 3. ht1R2 and ht1R3 are expressed in human tongue epithelium. cDNA-specific amplification products can be amplified from cDNA prepared from resected human circumvallate papillae (Echeverri, May 31st, 2001. Notebook No. 2, page 45) .
